

Your results

A brief guide to understanding your results

**Myers-Briggs Type Guesstimate** Currently unreleased. Information will be posted once it is.

**Most likely core enneatype** Your base Enneagram type, calculated by adding together and weighing your results on [Part II](#) against one another. This is why this core type may not necessarily follow from the Enneagram diagram you see above. Those numbers are calculated solely from [Part I](#). If you did not enter "tiebreaker mode," your core type will necessarily be the highest type you scored in Part I. If you did enter "tiebreaker mode" because your results coming out of Part I were too difficult to differentiate from one another, you were given adjectives for *multiple types* in Part II. What you scored then on Part II was tallied together to deliver you a **most likely core enneatype**.

**Closest wing to this core** This is the higher of the two possible wings adjacent to your type. If this ends up tied, your wings will be "balanced."

**With wings considered** This uses a **separate algorithm** from the "most likely core enneatype." Your results from [Part I only](#) are used to calculate this result. 18 different core+wing combinations are compared, and the highest of these 18 is selected.

**Wing strength** A qualitative evaluation of how strong your wing is relatively to your core type. This is NOT based on "most likely core enneatype." It is based on your "with wings considered" result.

**Instinctual variants** [Read section 1.3.](#)

**Significant integration patterns** If a type being considered for you by the test connects significantly along an integration path, it will be noted here. What is integration, you ask? [Read Russell Rowe's Heart and Defensive Points in section 1.4.9.](#) Most Enneagram authors assume that integration and disintegration are locked in specific directions (e.g. 7 integrates to 5 and disintegrates to 1). This is not the case; types merely connect along these lines.

**Differentiation factor** Not Enneagram related. It is a number that describes the significance of your "most likely core enneatype" result and can play a role in determining "certainty." Approximate its value to that which you see in z-scores to get *an idea* of how significant your "most likely core enneatype" is.

**Differentiation factor with wings considered** Same as above, but uses your "with wings considered" result instead.

**Tritype®** It's your Tritype®. Your gut type (one of 8, 9, 1), your heart type (one of 2, 3, 4) and your head type (one of 5, 6, 7) mashed together. It's ordered by strength for your convenience.

**Certainty** How certain is the test about your results? That's what that means.

**Overall Enneagram type** It's the test's best guess. What, you want to know more? That'd ruin the secret.
